

Validation rules do not belong to the *single case*.

Judge every exception by hand and sooner or
later you judge by mood.

The rule lives in the heads of *three people.*

They know which partner sends the wrong units and which customer may leave out the order number. Put one of them on holiday and chance decides — and at the close nobody can show why something went through.

VALIDATION PROFILE

One rule per document *type*.

The profile belongs to the document type and the interface, not to the individual message. Every order of the same type is checked the same way, whoever handles it.

The exception is configured, not *remembered.*

Partners who need their own rules get their own profile. That is configuration, not development — written down instead of passed on by word of mouth.

Now, later or in a *batch*.

- 01 Manually, when somebody should take a look
- 02 On arrival, when speed matters
- 03 In a batch, when volume is high

One set of rules, three ways to run it. The check stays the same; only its timing follows the business.

It says who did the *checking*.

Automatic or manual, with timestamp and user. At the close that is the difference between an answer and a guess.

Holiday is not a risk.

The rule keeps working when the experience is away.

A new partner costs an hour.

Assign a profile instead of coding a special case.

The auditor stops asking.

Who, when, under which rule — it is on the document.

IN SHORT

Checking is not diligence. *It is a rule.*

FlexxLink — the integration platform for Dynamics 365 — keeps validation rules in profiles on the document type instead of leaving them to people. Built by the Soluvine development team I have worked with for 25 years. The modules in detail: restless365.com

Configurable fitted to your process, not the other way round

30-day trial no obligation to buy

Microsoft AppSource product and trial access — soluvine.com
