

An error is not a *final state*.

What arrived wrong does not have to be rebuilt
by hand.

Re-typing it *by hand.*

When a message fails, somebody ends up keying the order in. The work is done twice, the document no longer matches what the partner sent, and the link between the two is gone.

The error *stays put.*

Whatever fails validation stays in error state — visible, with a reason, and unposted. Nothing disappears into a log nobody reads.

Usually it is not in the *message*.

A missing partner, an unknown item number, a unit the system does not have. The fix happens in Dynamics 365 — the message itself is left untouched.

Process again, do not *re-enter*.

A batch run picks up what was left behind and applies the same validation and posting rules as the first attempt. No typing, no side door.

What is not set up gets *reset*.

For document types without automation the record returns to its initial state — visible, waiting, not deleted. And how long completed records are kept is configured, not left to chance.

No double entry.

The cause gets fixed; the document is not rebuilt.

The evidence survives.

Original, reason and second attempt stay connected.

Cleanup is governed.

Retention per document type instead of tables that only grow.

IN SHORT

An error is not a dead end. *It is a queue.*

FlexxLink — the integration platform for Dynamics 365 — picks failed records up again once the cause is fixed. Built by the Soluvine development team I have worked with for 25 years. The modules in detail: restless365.com

Configurable	fitted to your process, not the other way round
30-day trial	no obligation to buy
Microsoft AppSource	product and trial access — soluvine.com
