

A folder is not an *interface*.

File drops work — until nobody knows whether anything was collected.

Nobody *confirms.*

A file in a directory does not tell you whether it was read, whether it was complete, or whether it was meant for you at all. When it is missing, no error appears — only silence.

Accepted or *rejected*.

Every message arrives at an endpoint and gets an answer. Access runs over OAuth 2.0 — a standard, not password files passed around. Your partner knows where they stand in the same moment.

Inbound and outbound, *one path.*

Orders in, confirmations and invoices out — over the same documented interface instead of three procedures that grew over time.

Including partners without *EDI*.

Small suppliers connect directly. Anyone running classic EDI comes in through the usual middleware. Both end at the same chain inside the ERP.

Every call leaves a *record*.

Who, when, with what content, with what result.
On a file share that is a directory listing with
timestamps — here it is a log you can show a
partner.

Partners stop chasing.

The answer is immediate, not a callback on Friday.

Onboarding takes days.

A documented endpoint instead of an agreed file format.

No file share in the critical path.

No dependency on folder rights and pickup scripts.

IN SHORT

An interface does not stay silent. *It answers.*

FlexxLink — the integration platform for Dynamics 365 — takes messages over documented endpoints and confirms every one of them. Built by the Soluvine development team I have worked with for 25 years. The modules in detail: restless365.com

Configurable fitted to your process, not the other way round

30-day trial no obligation to buy

Microsoft AppSource product and trial access — soluvine.com
