

The sender learns what became of their *message*.

Full transparency means the partner sees the status too, not only we do.

Transparency that stops at the *door*.

Most integrations log properly — inwards. The partner outside only knows they sent something. Whether it was posted, checked or rejected arrives by phone. Usually from finance, usually too late.

STATUS LOG

Every step
is *recorded.*

Intake, validation, approval, posting — every station leaves an entry with a timestamp and a result. Not a reconstruction from files, but a sequence you can read.

From arrival to *posting*.

The whole path is monitored, not just the start.
That is why absence shows too: a message that
is stuck, and one that never came.

STATUS API

The status goes *back*.

Through an interface the partner's own system can ask where a message stands — no call, no reply mail, no access to our ERP. They see what concerns their message and nothing else.

Trust becomes *evidence.*

When both sides see the same status, the argument about whether something was sent is over. What remains is what became of it — and that is answered.

The partner does not call.

They ask their own system, not our finance team.

Silence gets noticed.

The problem is rarely the breakdown; it is the absence.

Disputes are short.

Same sequence, same timestamps, both sides.

IN SHORT

Transparency does not stop at your *system border.*

FlexxLink — the integration platform for Dynamics 365 — logs every step and returns the status to the sender through an interface. Built by the Soluvine development team I have worked with for 25 years. The modules in detail: restless365.com

Configurable	fitted to your process, not the other way round
30-day trial	no obligation to buy
Microsoft AppSource	product and trial access — soluvine.com
