

Forty minutes for a document that existed *all along.*

An auditor asked to see one document. It existed — just not findable from where the work happened.

Compliance is not lost in a big *failure.*

It is lost in forty-minute searches nobody reports, because in the end everything was found. As long as the connection depends on folder names and memory, it lasts exactly as long as the people do.

Filing is *not archiving.*

The difference is timing. Internal documents are archived as they are generated — with references to account, document number, batch and date. More than twenty document types out of the box, connected to SSRS, Docentric, Lasernet, Electronic Reporting or Dox42.

Paper belongs to the *record*.

Upload	From any form, with configurable metadata
Scan	Barcode matching to the business record
Unknown type	Surfaces in the dashboard, admin assigns it
No match	Matched by hand in the scan dashboard

Found where the *work happens.*

Document viewer, ECM sidebar and a FactBox on the record — PDF, Office, images, e-mails. Plus full-text search across the archive's content, not just metadata. Visibility per document type through Dynamics 365 security.

Your archive stays the one *you have*.

Every document has a state.

Indexed, waiting, moved, in error.

The job retries by itself.

While the file is missing.

Reset instead of search.

Cause fixed, retry re-armed.

IN SHORT

An archive proves itself in the forty *minutes nobody needs any more.*

FlexxStore — the ECM solution for Dynamics 365 — connects the ERP with the archive you already run. Built by the Soluvine development team I have worked with since the Damgaard days.

20+ document types

archived out of the box

30-day trial

no obligation to buy
