

Report as finished must not *post first.*

Why the order of shop-floor feedback decides the cost price — and why the MES does not know that order.

The MES sends when something *is finished.*

Not in the order costing needs. Report as finished often arrives first — consumption and times follow minutes later, from other systems, in a different sequence.

No error. A wrong *cost price.*

If the order closes before times and consumption are posted, Dynamics 365 calculates with what is there. The result looks plausible. It is wrong — and nobody gets a message.

Effort first. *Then the close.*

Picking list	Consumption, with batch — first
Route card	Times and quantities per operation — first
Job card	Labour time with dimensions — first
Report as finished	Only once everything before it is posted

One priority per interface. *No rebuild.*

The lower number is processed first. A priority group is worked off completely before the next one starts — and within a group, older messages go first.

What this *prevents.*

-
- 01 Report as finished no longer overtakes consumption
 - 02 The cost price contains every effort of the shift
 - 03 No re-posting, no correction at the close
 - 04 The MES does not have to change its sequence
-

The order closes complete.

Not early.

The post-calculation is right.

The first time.

The MES stays as it is.

The order is made in the ERP.

IN SHORT

Sequence is not a detail. *It is the price.*

FlexxLink MES — the production module for Dynamics 365 — processes feedback by priority instead of arrival: consumption and times first, report as finished after. Built by the Soluvine development team I have worked with since Damgaard.

Priority per interface

a setting, not a rebuild

30-day trial

no obligation to buy
