

Picked is *not consumed.*

The warehouse knows which pallet was taken. The ERP deducts some batch. How picking list registration gets from the WMS into Dynamics 365.

Pallet 4711 picked. Batch B-207 *posted.*

The picker took what was at the front. The ERP posted what was oldest. Three months later a customer asked about a batch that, according to the system, had never been shipped to them.

Right in total. Wrong in *detail.*

Connect only one direction and you have a WMS that does not know what to pick — or an ERP that does not know what was picked. The second variant goes unnoticed.

What was taken. *Per line.*

Item, quantity

even if it was less

Batch

the one on the pallet, not the ERP's

Location, license plate

from where, and what is now empty

Lot ID

reference to the BOM line

One dimension sent — the whole group *applies*.

Product, storage, tracking: as soon as one dimension of a group is in the message, the whole group comes from the message. Location sent without warehouse — empty warehouse. That has to be agreed in the project.

Faulty lines *stay put.*

-
- 01 Picking list goes from Dynamics 365 to the WMS
 - 02 Registration comes back, validated against the profile
 - 03 Own validation journal: what is not at the location surfaces first
 - 04 Correct lines post through the posting profile
-

The batch from the scan is posted.

Not the one from the algorithm.

The WMS knows what to pick.

No printout.

A wrong pallet stops one line.

Not the list.

The one who saw it *posts it*.

FlexxLink Warehouse — the warehouse module for Dynamics 365 — sends the picking list to the WMS and takes the registration back with batch, location and lot ID. Built by the Soluvine development team I have worked with since Damgaard.

Picking list registration

with its own validation journal

30-day trial

no obligation
