

The forklift *does not post.*

Every movement that happens in the warehouse and not in the ERP is a stock difference with a time delay. How the movement journal gets from the WMS into Dynamics 365.

A note on the *steering wheel.*

Location numbers — from, to, from, to. To the office at the end of the shift, typed up. If it did not get lost. The warehouse system had every scan. The way into the ERP went through the note.

Changes no value. Only the *stock figure*.

Same quantity, same batch — only a different location. Financially neutral. And still where every stock difference begins: whoever cannot find the pallet creates an adjustment. Two errors from one movement.

From. To.

All dimensions.

Item, quantity, batch

unchanged — otherwise not a movement

From and to

site, warehouse, location, license plate, status

Journal number

collect per shift or one per movement

Post flag

post at once or leave standing

The forklift has already answered the *question*.

A movement that has happened is a fact. Whoever has it approved in the ERP first has two stocks for the duration of the approval. Validate yes — target location, license plate, batch. Ask no.

New license plate. *No standstill.*

-
- 01 The WMS assigns a new license plate while repacking
 - 02 FlexxLink validates it on import within site and warehouse
 - 03 If missing, it is created — when the setup allows
 - 04 Duplicates within the company run into an error, not into stock
-

The pallet is in the system where it is.

Not where it was the day before yesterday.

No note. No typing.

The scan is the posting.

Fewer adjustments without reason.

Because less searching.

Every movement is a *posting*.

FlexxLink Warehouse — the warehouse module for Dynamics 365 — receives movement journals from the WMS, validates dimensions and license plates, and posts automatically when it should. Built by the Soluvine development team I have worked with since Damgaard.

Movement journal

from the WMS, posted automatically

30-day trial

no obligation
