

Counted at the shelf. *Closed in the ERP.*

Stock counting is where it shows whether an integration thinks in both directions. How the counting journal goes from Dynamics 365 to the WMS — and comes back into the same journal.

4,000 lines. *As Excel.*

Three days of typing. 3,800 lines matched. The other 200 had a different order, a different batch spelling, or a location that did not exist in the ERP. Second journal.

A new journal is not a count. *A second stock figure.*

The spreadsheet is not the problem. The problem is that it loses the reference: which line in the result belongs to which line in the journal? Without an answer you have two stock figures — and have to choose one.

From the journal. *Triggered by hand.*

Journal number	the reference that holds everything together
Line number	per line — so the result finds the right one
Storage dimensions	location, batch, license plate
Item details	so the counter knows what is in front of them

One flag makes the *difference.*

“Update journal”: FlexxLink does not create a new journal but writes into the existing one. The journal number says which. The line number says which line. The count ends where it began.

Three fields. *Nothing else.*

01 Counted quantity

02 Worker who counted

03 Counting reason

04 Item, dimensions, expected quantity stay as the ERP
exported them

No Excel. No typing.

No second journal.

Every line knows who counted.

And why.

Somebody looks at the difference.

Then it posts.

The count is *a cycle.*

FlexxLink Warehouse — the warehouse module for Dynamics 365 — exports the counting journal to the WMS and writes the results back line by line into the same journal. Built by the Soluvine development team I have worked with since Damgaard.

Counting journal both ways

out, back, the same journal

30-day trial

no obligation
