

Two systems. *One stock.*

A stock reconciliation between WMS and Dynamics 365 is not a programme of its own. It is the result of six journals that post every movement — and one count that finds the rest.

“We need a
stock recon-
ciliation.”

The sentence comes up in every WMS project, usually in week three. It sounds like a requirement. It is a confession: movements get lost between warehouse and ERP — and we do not know which ones.

An adjustment without a reason. *Every night.*

The nightly reconciliation delivers 37 items with a difference. Not: why. The difference is the sum of all errors — and the sum says nothing about the summands.

Every movement. *One posting.*

Arrival, picking	the scan at the gate, the batch on the pallet
Movement, transfer	within and between warehouses
Adjustment	with reason code and a person in front
Counting	out, back, the same journal

Run as *a count.*

Export a counting journal, the WMS reports its stock back as a result, the differences sit line by line in the journal — with a reason, before posting. Not at night. Not automatically.

Sent against *posted*.

- 01 Has everything arrived that the warehouse sent?
 - 02 Received, validated, approved, posted — or rejected?
 - 03 A stuck movement is visible before it becomes a difference
 - 04 That is the reconciliation that is really missing
-

No nightly reconciliation.

No reason for one.

Every difference has an origin.

Not a sum.

Stock is a sum of postings.

Not a number you reconcile.

The sum of its *postings*.

FlexxLink Warehouse — the warehouse module for Dynamics 365 — posts six journals from the WMS in one workspace, with validation profile, approval and monitor. Built by the Soluvine development team I have worked with since Damgaard.

Six warehouse journals

one workspace, one monitor

30-day trial

no obligation
