

Archived when printed. *Not at month end.*

A document that is exported some time after posting is filed — not archived. How internal documents from Dynamics 365 reach the archive the moment they are created.

Three weeks *without export.*

The export ran at two in the morning. For three weeks it did not — a certificate had expired. The invoices were posted, the customers had them. Only the archive knew nothing.

Filing is some time. *Archiving is now.*

In FlexxStore the archive entry is created in the same moment as the document — with account, document number, date, batch. There is no state in which a document is posted but unknown to the archive.

Bound to the report. *Not to the folder.*

Origin internal

the report that produces the
document

Document module

where the type appears in the viewer

Reporting engine

whichever runs in the company

Translation

the name in the user's language

One rule. *Five paths.*

-
- 01 SSRS and Docentric: from the print archive — “Force print to archive”
 - 02 Lasernet: entry at report time, PDF follows via batch or directly
 - 03 Electronic Reporting: bound by report name
 - 04 Dox42: archived after every print, no further setup
-

Three batches. *Three references.*

A packing slip with three batches is one document but three references. FlexxStore creates one archive entry per batch — so traceability leads from the batch to the paper.

The invoice is archived when posted.

Not after the night.

No export that fails silently.

Because there is none.

The preview is there before the file is copied.

Index first.

IN SHORT

Indexed at creation. Never *searched for.*

FlexxStore — the ECM solution for Dynamics 365 — archives internal documents the moment they are created, from any reporting engine, with references. Built by the Soluvine development team I have worked with since Damgaard.

20+ internal document types	out of the box, five reporting engines
30-day trial	no obligation
