

Found where *the work happens.*

A document you have to leave the ERP for is only half archived. Viewer, sidebar, fact box, full-text search — and why an XML invoice has to be readable.

The archive had everything. *In the anteroom.*

Open a second application, log in, type the vendor number — and know that “invoice” is called “incoming document” there. The accountant knew that. Purchasing called her.

Every switch is a reason *not to look.*

A login, a search form, a translation of terms. None of it is hard. All of it is enough to call instead.

No second *application.*

Document viewer	tree and grid, by module, with preview
ECM sidebar	the documents for this record
Fact box	shows there are some
PDF, Office, images, e-mail	preview before the file is copied

Finding what you *do not know*.

Metadata finds vendor, number, date. Full-text search finds the clause in the contract, the item number in the correspondence — it asks the archive for content. Prerequisite: version 3.3.5 and a Content Web Service connection.

An invoice. *No brackets.*

-
- 01 CII and UBL are made for machines
 - 02 FlexxStore renders them as HTML via XSL transformation
 - 03 One transformation per document type, replaceable
 - 04 The e-invoice looks like an invoice
-

Purchasing sees the document on the vendor.

Without calling.

The tree is named the way the company thinks.

Functional or by process.

The e-invoice is readable.

For the business too.

Half archived is *not* archived.

FlexxStore — the ECM solution for Dynamics 365 — shows documents where the question arises: viewer, sidebar, fact box, full-text search. Built by the Soluvine development team I have worked with since Damgaard.

Three views in the ERP

plus full-text search in the archive

30-day trial

no obligation
