

No permission, *no result.*

An archive in the ERP may only go live when permissions are right. How visibility per document type is controlled through Dynamics 365 security — without a second rights management.

“Who sees the
personnel files?”
Three weeks.

The project was finished. Then the works council asked. The answer took time because the archive had its own rights management. Full-text search found the files, by the way. For everybody.

Two places where something *can be wrong.*

FlexxStore has no rights management of its own. It uses roles, duties and privileges of Dynamics 365. Lose the role, lose the documents with it. No second administrator, no second user list.

Not greyed out. *Not there.*

Viewer, sidebar	the type is missing from the tree
Full-text search	returns no hits from restricted types
Add file	only what you would be allowed to see
Internal documents	follow the permissions on the record

Assign. *Do not invent.*

-
- 01 Use full-text search · Add file · Scan file
 - 02 View configuration · Maintain configuration
 - 03 Scan dashboard · Scan dashboard with delete
 - 04 ECM administrator: dashboard, reset, edit, delete
-

The same rule for what *comes in.*

Without permission for the scan type “job application”, the scan dashboard shows no unmatched applications — not even to match them. Deleting is a privilege of its own. That is the difference between a dashboard for anybody and one for the works council.

The works council's question takes
a minute.

Not three weeks.

A leaver is locked in one system.

And with it the archive.

Search finds only what you may
see.

In full text too.

IN SHORT

Permissions are why it may *go live.*

FlexxStore — the ECM solution for Dynamics 365 — controls visibility per document type through the ERP's security, without a second rights management. Built by the Soluvine development team I have worked with since Damgaard.

Permissions per document type

via D365 roles and privileges

30-day trial

no obligation
