

EDI is usually *a back door.*

Data lands in Dynamics 365 and nobody knows who sent it, whether it was checked — or when it went missing.

Every message *visible.*

Who sent it, what it said, what became of it. Not in the log of a black box, but in plain language for the business and for partners.

Check first. Then *post*.

- 01 Validation framework in the staging layer
- 02 Only valid data reaches Dynamics 365
- 03 Faulty messages stay where they are, traceable

The difference between an error in staging and an error in the ERP is one hour or one quarterly close.

REST

*instead of file drops
and hope.*

Modern, documented communication any partner can connect to — including those running no classic EDI at all.

End to end. From arrival *to posting.*

The most common EDI failure is not the error, it is the message that never arrived. So the module watches the whole path — and reports silence, not just breakdowns.

A messaging framework, *not a one-off.*

Every new message format is configuration, not development. That is why B2B, MES and WHM rest on the same foundation.

Built at a time when nobody *could travel.*

- 01 Mockup — the idea becomes visible before it becomes expensive.
- 02 Prototype — on the real process of a real client.
- 03 Handover to the Soluvine development team — where it becomes dependable software.

IN SHORT

EDI is not data transport. *It is trust.*

This module is dependable because clients reported every exception — built by the Soluvine development team I have worked with for 25 years. The story behind it:
restless365.com

Configurable	fitted to your process, not the other way round
30-day trial	no obligation to buy
Microsoft AppSource	all solutions available there — soluvine.com
