

Four stations before anything *is posted.*

Why an incoming message should not become a posting in Dynamics 365 straight away.

A posting cannot be taken *back.*

It can be corrected — with a second posting, an explanation to finance, and a trail that stays visible at the close. So what matters is not how fast data is taken in, but what was checked before it was.

INTEGRATION JOB

The message exactly as it *arrived.*

Every incoming message is first recorded unchanged — with timestamp, sender and the original content available for download. That is the evidence that counts when a partner disputes it.

IMPORT JOURNAL

Technical data becomes a *business case.*

The message turns into lines, quantities, prices, partners — readable for the business and still outside the books. This is where the business works, not IT.

Checked. Then *approved.*

- 01 The rules belong to the document type, not to the individual case
- 02 What fails stays put — with a reason, not as an error message
- 03 Approval is on record: who, when, on what basis

Only what has been approved *gets posted.*

A document in Dynamics 365 appears only at the end of the chain. Everything before it is traceable, correctable and repeatable — with no reversal needed.

The error has a place.

Finance stops searching; the list already shows it.

The approval has a name.

Auditable at the close, with no reconstruction from log files.

The second attempt is cheap.

Correct and reprocess instead of reversing and posting again.

IN SHORT

Integration is not transport. *It is a procedure.*

FlexxLink — the integration platform for Dynamics 365 — puts every message through the same chain: record, translate, check, approve, post. Built by the Soluvine development team I have worked with for 25 years. The modules in detail: restless365.com

Configurable	fitted to your process, not the other way round
30-day trial	no obligation to buy
Microsoft AppSource	all solutions available there — soluvine.com
