

Every partner sends their own *format.*

And that must never trigger a development project.

One format for everyone — and *none of them fit.*

Force a standard and you lose the partners who cannot deliver it. Code a special case for each and two years later you maintain thirty special cases. Both end up in development.

INTEGRATION PARTY

A place for every *partner*.

Customers and vendors live in one table — with their interfaces, their endpoints and their rules, in both directions. Not in emails, not in the head of whoever looks after them.

Who sent this *anyway?*

- 01 Customer or vendor number taken from the message
- 02 GLN — also from the address when the party has none
- 03 Bar code, where the document comes off the floor

How a partner is recognised is configured per partner. A message assigned to the wrong party is the most expensive error in EDI.

XSLT

Format stays *configuration.*

Mapping into and out of a partner's format sits in a replaceable transformation, not in program code. A new format is a file, not a release.

Per partner, per *message*.

The same customer can send orders in one format and expect invoices in another. Both belong to that partner, both apply independently — and either can change without touching the rest.

A new customer does not wait for a release.

Create the party, assign the format, test.

The special case stays visible.

It sits on the partner, not in a line of code.

Thirty partners are not thirty projects.

Same chain, different translation in front of it.

IN SHORT

Variety is not a defect. *It is configuration.*

FlexxLink — the integration platform for Dynamics 365 — keeps partners, identification and per-message formats in one place. Built by the Soluvine development team I have worked with for 25 years. The modules in detail: restless365.com

Configurable	fitted to your process, not the other way round
30-day trial	no obligation to buy
Microsoft AppSource	all solutions available there — soluvine.com
