

The shelf is  
always right.  
The stock figure  
*is not.*

---

What warehouse movements really have to do in  
Dynamics 365 — and why creating is not posting.

"The stock figure  
is never right  
*anyway.*"

That sentence is not a complaint, it is a work instruction: people in the warehouse look at the shelf. People in purchasing look at the system — and order against numbers nobody in the warehouse trusts.

# Every movement without a posting *becomes a gap.*

Goods are moved because the day demands it. In the system they still sit where they sat the day before yesterday. The adjustment arrives days later — with no reason. In accounting terms that is a change in value nobody can explain.

# Six journals.

## *No universal interface.*

---

|              |                                                |
|--------------|------------------------------------------------|
| Item arrival | Goods receipt from the warehouse system        |
| Movement     | Between locations, with storage dimensions     |
| Adjustment   | Inventory correction — with a reason           |
| Transfer     | Between warehouses or sites                    |
| Counting     | Results back into the ERP                      |
| Picking      | Registration feedback, with validation journal |

---

# Creating is *not posting.*

Validated, approved — and then created as a journal in D365. It is only posted if that is configured. Relocations may run straight through; adjustments and counts stay until somebody looks. Configure it the other way round and two weeks later you have an inventory difference nobody can attribute.

# The part that *stalls projects.*

- 
- 01 Required license plate values are validated on import
  - 02 Missing plates and batches are created when the setup allows it
  - 03 The search runs inside the site and warehouse passed in
  - 04 Limits: no automatic parent plates — and numbers must be unique across the tenant
-

---

# Exported by hand.

Counting journal with all lines and storage dimensions.

---

# Counted in the warehouse.

Where the shelves are.

---

# Back into the journal.

The existing one, not a new one.

# A stock figure nobody trusts *costs more.*

With a wrong figure you correct a number. With a distrusted one, somebody walks over and looks — every day. FlexxLink Warehouse brings every movement into Dynamics 365 as a journal with an origin, a validation and a timestamp. Built by the Soluvine development team I have worked with since the Damgaard days.
