

A batch was consumed. *Not an item.*

Why a picking list from the shop floor has to carry more than a quantity — and what happens when it does not.

Inventory takes whatever it *finds first.*

If the shop floor only reports “12 pcs of item 4711”, Dynamics 365 picks some batch. Traceability is then right on paper — and the wrong pallet is sitting in the hall.

Traceability is not a report. *It is a posting.*

When the recall comes, what the MES logged does not count. What counts is which batch the ERP took off the order — and whether the two are the same.

One line. *Every dimension.*

Batch	the number of the pallet actually used
Serial number	when the part counts individually
Location, license plate	where it really came from
Error cause	material, machine or operator
Scrap	as its own quantity, not as shrinkage

End of consumption is *a checkbox.*

The line can say that nothing more is coming for this position. Then planning knows the remainder is no longer needed — instead of carrying it along as open.

Checked. Then *deducted*.

-
- 01 Does the line belong to this order?
 - 02 Does the batch exist at the reported location?
 - 03 Does the unit match the BOM?
-
- 04 Whatever fails stays on the order — unposted, with a reason

The right batch is gone.

Not just any.

The recall takes minutes.

Not days.

Scrap has a cause.

Not just a quantity.

IN SHORT

A quantity is a number. *A batch is origin.*

FlexxLink MES — the production module for Dynamics 365 — accepts the picking list with every inventory dimension: batch, serial, location, license plate, error cause. Built by the Soluvine development team I have worked with since Damgaard.

Configurable	fitted to the process, not the other way round
30-day trial	no obligation
Microsoft AppSource	all solutions available there — soluvine.com
