

Time is not a note. *Time is a posting.*

Why route card and job card should come from the shop floor — and what post-calculation gets out of it.

The hour is on the slip. *Not on the order.*

Times are recorded — in the terminal, in the MES, on paper. They rarely end up where they are costed: as a journal line on the operation of the production order.

Without actuals, D365 costs *with the plan.*

Post-calculation takes what is posted. If actual time is missing, planned time remains — and the question whether an operation takes too long is never asked, because it never becomes visible.

Operation *and person.*

Route card

Times and quantities per operation —
setup, run, good quantity, scrap

Job card

The same times per job and resource
— with financial dimensions on the
line

Both

Created as a journal in D365, validated,
then posted

Cost centre comes along. *On the line.*

Financial dimensions are carried onto the journal lines in full or in part. The hour is then tied not only to the order but to the cost centre that caused it.

Checked. Then *posted*.

-
- 01 Does the operation exist on the order?
 - 02 Is the resource known and active?
 - 03 Is the order in a status that allows time?
 - 04 Whatever fails stays put — with a reason, unposted
-

Post-calculation is actual.

Not plan.

No slip at the end of the shift.

No re-keying.

The operation shows what it costs.

Every day.

What is not posted *cost nothing.*

FlexxLink MES — the production module for Dynamics 365 — accepts route card and job card from the MES and posts them as journals on the operation, with financial dimensions. Built by the Soluvine development team I have worked with since Damgaard.

Configurable	fitted to the process, not the other way round
30-day trial	no obligation
Microsoft AppSource	all solutions available there — soluvine.com
