

One vessel. Three products. *One report.*

Process manufacturing reports back differently from discrete — main product, co-product, by-product. What the interface has to handle.

One batch does not yield *one item.*

Chemicals, food, pharma: a batch order produces several results. An interface that only knows “quantity finished” reports exactly one of them.

What is not reported is *not there.*

The co-product then enters stock by hand — or not at all. The by-product becomes shrinkage. And costing spreads the cost over one product instead of three.

Three lines. *One journal.*

Main product

the goal of the batch, with quantity and batch number

Co-product

a second saleable product made alongside

By-product

what falls out — with value, without, or with disposal cost

In one journal. *Or separately.*

Report as finished accepts main, co- and by-product in one journal — or as separate messages when the floor knows them at different times. Both post to the same batch order.

BOM *and formula.*

-
- 01 Discrete: bill of material, route, production order
 - 02 Process: formula, batch order, co- and by-products
 - 03 Same message, same chain, same validation
 - 04 What the plant makes is decided by configuration — not by the interface
-

The co-product is in stock.

No manual posting.

Cost is spread.

Over everything that was made.

One plant, two kinds of manufacturing.

One integration.

A batch is not a piece. *It is a result.*

FlexxLink MES — the production module for Dynamics 365 — reports main product, co-products and by-products as finished for batch orders, in one journal or separately. Built by the Soluvine development team I have worked with since Damgaard.

Configurable	fitted to the process, not the other way round
30-day trial	no obligation
Microsoft AppSource	all solutions available there — soluvine.com
The full piece	restless365.com/post-process-manufacturing
