

The floor does not ask. *It knows.*

Integration status log and end-to-end monitoring:
why an interface is only finished when
downstream processing in Dynamics 365 is visible
too.

“Received” does not mean “*posted*”.

Most interfaces tell the MES: message received. What happens next — validated, rejected, posted, stuck — stays in the ERP. The floor finds out when somebody calls.

Errors announce themselves. *Silence does not.*

A message sitting in the import journal that never gets posted raises no error. It creates stock that is wrong and an order that stays open — until somebody notices.

Every step. *One entry.*

Job ID	the message in question
Status and time	accepted, validated, approved, posted, rejected
Error code	configurable per interface and validation rule
Message	the reason, readable

Query it. Or *get told*.

The MES queries the status of its message through an interface — or FlexxLink sends it actively as soon as a configured state is reached. Per interface you set which events are logged and which are sent.

Monitored *through to posting.*

- 01 Did the message arrive?
 - 02 Was the journal created in Dynamics 365?
 - 03 Was it posted — or is it stuck?
 - 04 Silence shows up where it occurs, not at month end
-

Nobody calls.

The MES knows.

An error has a code.

Not just a text.

The interface ends at posting.

Not at receipt.

An interface does not end *at receipt.*

FlexxLink MES — the production module for Dynamics 365 — logs every step, reports status back to the MES and monitors processing through to posting. Built by the Soluvine development team I have worked with since Damgaard.

Configurable	fitted to the process, not the other way round
30-day trial	no obligation
Microsoft AppSource	all solutions available there — soluvine.com
