

Arrived is what *was scanned.*

Goods receipt happens at the gate, not in the ERP.
How the item arrival journal gets from the
warehouse system into Dynamics 365 — and why
the delivery note should not be posted.

40 on the
delivery note.
38 at the gate.

The ERP posted the delivery note. Two pallets that never existed sat in stock for four weeks. Sales sold them. Shipping looked for them.

A delivery note is an *intention*.

A scan is an event. The warehouse system knows only the event — pallet, batch, license plate. The ERP knows the intention. What should be posted is the event.

What stood at the gate. *Not on paper.*

Item, quantity

what actually arrived

Site, warehouse, location

the dimensions as the WMS knows them

Batch, license plate

traceability begins at the gate

Journal number

append to an existing one, or new

What the WMS reports, the ERP does *not know yet.*

FlexxLink validates required license plates and batches on import and creates missing ones if the setup allows. The numbering logic has to be agreed once — or it catches up with you at the first duplicate.

One parameter. *One decision.*

-
- 01 Validate against the validation profile
 - 02 Approve — manually or automatically
 - 03 Create as an arrival journal in Dynamics 365
 - 04 Post only if the interface is set up to
-

Purchasing sees the scan.

Not the delivery note.

A partial delivery stays partial.

Not a full order.

38 instead of 40 is a complaint.

Not a counting difference.

Stock begins *at the gate.*

FlexxLink Warehouse — the warehouse module for Dynamics 365 — receives arrival journals from the WMS, validates batches and license plates on import, and posts when it should. Built by the Soluvine development team I have worked with since Damgaard.

Configurable	fitted to the process, not the other way round
30-day trial	no obligation
Microsoft AppSource	all solutions available there — soluvine.com
