

Between two warehouses *stands a truck.*

What has left site A and not yet arrived at B still belongs to somebody. How the transfer journal gets from the WMS into Dynamics 365 — and why it is not a movement journal.

Three hours of *nobody's pallet.*

A had deducted it — gone. B had not received it — not there. In those three hours sales sold it twice. Once in A, once in B.

In transit is not nothing. *It is stock.*

Within one warehouse the only question is: which location? Between warehouses a second one arrives: whose stock is the pallet while it travels? Whoever does not answer sells it before it arrives.

From. To.

Two stock pictures.

Item, quantity, batch	what leaves the site
From	site, warehouse, location, license plate
To	the receiving location of the other warehouse
One journal per truck	what travels together posts together

Post once. *Not twice.*

A has one WMS, B another — or none. A reports the issue, B the receipt, both describe the same event. It is posted once, by the system that triggered it. That is a project decision before the first message.

No value moves.

So yes — mostly.

-
- 01 Validation on both sides: target location, batch, license plate
 - 02 Validation through — post, as with the movement
 - 03 Exception: inspection on receipt at the target site
 - 04 Exception: days in transit — then transfer order instead of journal
-

Sales sees what is in transit.

And sells it once.

A transfer is a transfer.

Not a movement with a long way.

One system posts.

The other one is told.

In transit is *a stock.*

FlexxLink Warehouse — the warehouse module for Dynamics 365 — receives transfer journals from the WMS, validates source and target, and posts when it should. Built by the Soluvine development team I have worked with since Damgaard.

Configurable	fitted to the process, not the other way round
30-day trial	no obligation
Microsoft AppSource	all solutions available there — soluvine.com
